

## **Flexible Solutions Announces NSF Approval**

2012 has already been a big year for Flexible Solutions, the manufacturer of the original liquid pool covers, Heatsavr and Ecosavr.

A special announcement was made late 2011 detailing their new formula for Heatsavr. By replacing the Isopropyl Alcohol with a bio-based Ethanol, the company was able to make their product even more environmentally friendly and appealing to pool owners and operators.

Now, in February of 2012, Flexible Solutions is excited to announce that they will be launching "Heatsavr Pro," an NSF Approved version of their tested and proven product.

Over the years, Heatsavr has been very popular in Commercial Aquatics Centers, but as legislation becomes more and more controlled, they decided that NSF Approval for their product was prudent and should be obtained.

As it turned out, the only thing between the product and NSF Approval was an amended dosage rate, to ensure that the product was safely and adequately metered out throughout a 24 hour period, rather than the previous once-daily dosage instructions.

The same amount of product is required to cover the surface of the pool, but now commercial facilities are instructed to split their dosage into smaller, more frequent applications each day. The recommended HS115 Automatic Metering System can be easily programmed to handle this task for facility operators.

The dosage for Heatsavr Pro is as follows:

Directions: For best results, using an Automatic Metering Pump, add 1oz per 4,800 sq ft (approx. 180,000 gallons, based on a 5ft pool depth) every 2 hours.

The launch of Heatsavr Pro is scheduled for April, 2012 when their relabeled NSF approved product will be ready for shipment.

You can view the listing on the NSF website at: <http://goo.gl/XcZ8y>

Any questions about Heatsavr Pro can be directed to the division manager:
