

Say “No!” to 5G High Radiation Antennas in Our Neighborhood!

New 5G antennas are being installed rapidly all over cities, in front of homes and on streetlights. Because 5G millimeter waves are transmitted through focused beams, 5G antennas will be more numerous and closer to homes than 4G antennas, which will cause unprecedented exposure to high radiation levels.

Toxic effects Studies have shown that cell tower radiation in close proximity is carcinogenic, immune weakening, and neurotoxic to all life, including children, birds, insects and wildlife. Headaches, insomnia, dizziness, cognitive problems, arrhythmias, chest pain, and rashes have been reported after transmitters were installed close to homes. These are “non-thermal” effects, not intense enough to heat us up, and our US government does not attempt to protect us from them. Also, 5G will cause energy use to grow by 160% in 10 years.

What is 5G? 5G is the 5th Generation of wireless communication which has been marketed as enabling the “Internet of Things”, which plans to connect everything to the internet, like diaper sensors, pill bottles, and washing machines. 5G can use 2G, 3G, and 4G, but it can also use millimeter waves, which has been shown to have harmful effects and for which industry has not proven long-term safety.

OTARD The FCC passed a regulation in March 2021 that will increase the radiation exposure from 5G even more. The expanded OTARD (Over the Air Reception Device) Rule allows 5G small cell antennas to be put on homes with no notice to neighbors, treating them like harmless satellite dishes instead of the two-way radiating transmitters that they are. This way, cell phone companies can avoid regulation by local governments. Homeowners have been enticed with ads for free service or financial incentives to provide 5G to their neighbors, with no warning of the health hazards to them and their neighbors, a blatant deception!

We can **stop** OTARD in our neighborhoods! Copy this leaflet and alert your neighbors!
